

CLAIMS

1. A message machine comprising a backrest provided on a chair for the person to be massaged to sit in, and a message
5 unit reciprocatingly movable upward and downward longitudinally of the backrest and having a pair of therapeutic fingers projecting from the backrest,

 the message machine being characterized in that the machine comprises a pushing-out mechanism for moving the
10 message unit forward or rearward relative to the backrest.

2. The message machine according to claim 1 wherein the pushing-out mechanism tilts the message unit to thereby tilt the therapeutic fingers.

3. The message machine according to claim 1 wherein
15 the pushing-out mechanism comprises a crank mechanism.

4. The message machine according to claim 3 wherein the backrest is provided inside thereof with guide rails along the backrest, and the message unit is provided at upper and lower portions thereof with respective rollers fitting in each
20 of the guide rails, one pair of upper or lower rollers being movable forward or rearward by the crank mechanism relative to the message unit to thereby tilt the message unit.

5. The message machine according to claim 4 wherein the crank mechanism comprises crankpins rotatably carrying the
25 rollers thereon, and a crankshaft supporting the crankpins in

an eccentric position, and the rollers are moved forward or rearward relative to the massage unit by rotating the crankshaft to thereby tilt the massage unit.

6. The massage machine according to claim 5 wherein
5 the massage unit comprises a nut movable upward or downward within the massage unit by the thrust of a screw, and the nut is connected to the crankshaft by a link mechanism comprising a link and a link piece for converting the upward or downward
10 movement of the nut to the rotation of the crankshaft to thereby move the rollers forward or rearward relative to the massage unit and tilt the massage unit.

7. The massage machine according to claim 5 which comprises pushing-out sensor means for detecting the amount of pushing-out of the massage unit, and the sensor means
15 measures the angle of rotation of the crankshaft to thereby detect the amount of pushing-out of the massage unit.

8. The massage machine according to claim 6 which comprises pushing-out sensor means for detecting the amount of pushing-out of the massage unit, and the sensor means
20 measures the angle of rotation of the crankshaft or the link piece to thereby detect the amount of pushing-out of the massage unit.
